Bash Script (Linux commands)

Here you will see a summary of the common commands use in Linux (Unix) environment. We will just give examples of the ones we will use more frequently during the workshop. This commands can't be used in Windows environment unless you use a Linux emulator. If you need information in the terminal about an specific Linux/Unix command you can type a command line on the terminal:

```
$ man ls
```

To escape from the manual, just type: q

File Commands

```
FILE COMMANDS
Is -al
                    =>Display all information about files/ directories
pwd
                    =>Show the path of current directory
mkdir directory-name
                          =>Create a directory
                          =>Delete file
rm file-name
rm -r directory-nam
                          =>Delete directory recursively
                          =>Forcefully remove file
rm -f file-name
rm -rf directory-name
                         =>Forcefully remove directory recursively
cp file1 file2
                    =>Copy file1 to file2
cp -r dir1 dir2
                    =>Copy dir1 to dir2, create dir2 if it doesn't exist
mv file1 file2
                    =>Rename source to dest / move source to directory
In -s /path/to/file-name link-name
                                         #Create symbolic link to file-name
                    =>Create or update file
touch file
                    =>Place standard input into file
cat > file
more file
                    =>Output contents of file
                    =>Output first 10 lines of file
head file
tail file
                    =>Output last 10 lines of file
tail -f file
                    =>Output contents of file as it grows starting with the
                      last 10 lines
gpg -c file
                    =>Encrypt file
gpg file.gpg
                    =>Decrypt file
                    =>print the number of bytes, words, and lines in files
xargs
                    =>Execute command lines from standard input
```

Examples - working with directories:

```
$ ls
$ ls -al
$ ls -alrt
$ pwd
$ mkdir codes
$ mkdir temp temp1
$ mkdir -p temp2/ok
$ cat file.txt
$ cat file.txt file2.txt > fileOut.txt
$ rm file.txt
$ rm -r temp2/ok
$ rm -r temp2
$ df -h
```

Note: rm * it is a dangerous command that should be use with care, you might lose all your work!!

Examples - Create a File:**

Method 1: Using nano editor:

```
$ nano file.txt
```

Then you will get the screen editor where you can type in e.g. type echo "Hello World!".

To save your changes and exit the editor type: **ctrl + x** and choose **Yes** to save your changes. **Method 2:** Using **cat** command.

```
$ cat >file2.txt
"Hello Universe!"
```

To exit press: ctrl + d".

Directory

```
cd .. =>To go up one level of the directory tree
cd =>Go to $HOME directory
cd /test =>Change to /test directory
```

Disk usage

```
df –h =>Show free space on mounted filesystems
df -i =>Show free inodes on mounted filesystems
fdisk -l =>Show disks partitions sizes and types
du -ah =>Display disk usage in human readable form
du -sh =>Display total disk usage on the current directory
findmnt =>Displays target mount point for all filesystem
mount device-path mount-point =>Mount a device
```

File transfer and Remote Access

Search

System

SYSTEM	
uname -a uname -r uptime hostname hostname -i last reboot date cal w whoami finger user	=>Displaylinux system information =>Display kernel release information =>Show how long the system has been running + load =>Show system host name =>Display the IP address of the host =>Show system reboot history =>Show the current date and time =>Show this month calendar =>Display who is online =>Who you are logged in as =>Display information about user

Process Related

PROCESS RELATED			
ps	=>Display your currently active processes		
ps aux grep 'telnet' =>Find all process id related to telnet process			
pmap	=>Memory map of process		
top	=>Display all running processes		
kill pid	=>Kill process with mentioned pid id		
killall proc	=>Kill all processes named proc		
pkill process-name	=>Send signal to a process with its name		
bg	=>Resumes suspended jobs without bringing them to foreground		
fg	=>Brings the most recent job to foreground		
fg n	=>Brings job n to the foreground		

Virtual terminal (Screen)

Screen command	Description
screen -S name_of_terminal	Assigning name to the virtual terminal or screen session.
screen -1s	List all the virtual sessions or screens opened.
<pre>screen -X -S name_of_terminal quit</pre>	Kill an specific virtual terminal.
screen -r name_of_terminal	Attach to the virtual terminal or screen.
